

Pose Converter Genesis 2 Female(s) to Genesis 3 Female(s)  
User Instructions

created by 3D Universe 2015

This script is designed to automatically convert figure poses saved for Genesis 2 in .duf format to their Genesis 3 equivalent (also saved as a .duf file).

When run, the script offers a few options.

1) "Converted Pose Filename" refers to the new file that will be created for each .duf pose file. By default, the script will add "\_G3" to the filename. So for example the following pose file:

Model Pose 01.duf

will be converted and saved as:

Model Pose 01\_G3.duf

in the same folder as the original pose file.

2) "Copy Pose Thumbnails" specifies whether you'd like the content library thumbnail icon for the original pose file to be copied to the new converted filename. By default this option is on and a thumbnail will be created. If turned off, the converted pose file will have the default "no icon" DAZ image.

3) "Include Joint Adjustments" offers the feature of matching Genesis 3's default pose to Genesis 2's default pose. If this option is selected, adjustment values are applied to the legs and arms to closer match Genesis 2. By default this option is on.

Note: for some poses, this option gives a closer match on Genesis 3 to the original Genesis 2 pose. However, results may vary.

When the "Browse for .DUF File/s" button is activated, you will be presented with a multiple file selection window. Holding [shift] while selecting the pose files you wish to convert will enable you to select multiple pose files at once.

Once the "Open" is button activated, the script will do its work and give a summary at the end of the process.
