

Auto Adapted Morphs are generated when you apply a shape to your Genesis 8 Figure. You will find these morphs in the parameters tab of Daz Studio under the nail gems figures.

If you wish to zero out the effect of the shape on the nail gems, you will need to manually edit the parameters and resave them.

This image shows the default settings of the shape on the gems. The next image will show how to set your parameters to zero out the shape on the gems figure.

You will want to zero out the values on the auto adapted morph as pictured. Doing so essentially zeros out the ability of the gems to auto-follow the shape.

You can then save this file to the directory of your choice to retain these shapes for future use. Once saved, the shape files will be called to and added to the gems on load. If you do not save the adapted morph, you will need to repeat this process each time you wish to use the gems on that particular nail shape.
